HCO BULLETIN OF SEPTEMBER 9, 1959

Some Observations on S.22

The following observations made when instructing the Staff Theta Clearing Course in London may be of interest.

Students on staff course switched onto S 22 as they individually flattened terminals they were running on Selected Persons Overt-Withhold Straightwire. As of last Sunday night, majority of students had received 5 3/4 hours processing on S.22. I've never seen a process bite so widely so hard. Here's how it looks from the instructor's point of view:

Communication changes: First session majority on 5-10 sec comm-lags, second session up to 5-min comm-lags and now, anything. Hardly any pc's looking their auditor in the eye. For what it's worth, last Sunday 20 out of the 28 were working eyes shut! Yet particularly noticeable was the way in which pc's came into better communication with their auditors and more interested in own case - so the process obviously slaps them into session.

Emotion changes: Lot of minus tone-scale stuff about, with every so often someone hitting grief or overt hostility. Occasional line-charges. Process seems to be freeing up pc's on their displaying emotion: I see a lot more emotion displayed around HASI these days than before.

Changes in physical demeanour: Talk about rock'n'roll - on S 22 they squiggle'n'squirm. Bodies either doubled up forwards or lolling backwards or sideways. N.B. They yawn and yawn and yawn, sometimes just about non-stop; sounds like a herd of cattle sometimes. Somatics rampant; everyone's had them and they range from toothache to indefinite internal pains. Also interesting is the number of people reporting "things happening" between sessions. Cognitions, anaten and nightmares, the last to the surprise of pc's who haven't had them since childhood.

Cognitions: Considerations on "what's a victim" changing. Level of overtness coming up. Majority reporting increased willingness to communicate, increased ability to recall. Many also getting their first subjective reality on past lives through "pictures I've never seen before". Interesting also, pc's say they're taking more responsibility for ARC breaks, in own lives.

E-Meter reactions: This is really something. More needle and tone-arm action than I've seen on any other process. Tone-arm can swing around from about clear reading to 5 then back to bottom of dial several times in a 1 1/2 hour session. As with other Formula 10 processes, tendency for pc's to flip straight into opposite sex valence and clear reading on meter. Plenty needle action during dope-off, particularly with few cases who say "nothing much happening" - it's happening all right, but they're at bottom of Reality Scale.

Results: Haven't individually checked with each student, but people are being more at cause, more overt and in better communication. ARC among staff is higher, though this is to some extent due to their all being on course together and the resultant greater reality they're getting. I'd say morale was higher than before you started this course, and that's for sure. And the unit's better.

We started the course with 30. Two students left staff. Another two left course when HCO moved to Saint Hill. But with four newcomers, we've still got our 30 - and they are working and doing a good job. So much so that I consider a congratulatory message from you would be very much in order. They've earned a pat on the back.

Should you want to see them, I've auditors' reports galore on S 22 from which, together with my own observations, I've compiled this report.

That's all for now, am very interested to see how far they'll go on "victim".
