Washington 9, D. C.  
(Issued HCO WW-Reissued HCO DC)

HCO BULLETIN OF OCTOBER 29, 1959.

B.P.I. Communication Process and Havingness

It is not necessary to run havingness processes with the Communication Process, which is: "From where could you communicate to a \_\_\_\_\_ (generalized terminal)".

If the PC drops havingness while running the comm process it is more likely to be due to the auditor having selected the wrong, or an unreal, terminal and then compounded it with ARC breaks. In short, PC is not in session.

To alternate a comm process with a havingness process is a Q & A with the pre-clear.

The communication process raises havingness by reducing obsessive individuation of the PC from others.

KAYE THOMSON  
HCO Technical Secretary WW

B.P.I. HCO BULLETIN OF OCTOBER 30, 1959.

To Retain Co-Audit PC's Interest in Case

All auditors should remember the definition of a pre-clear in session and that is : that he is interested in and talking to the auditor about his case.

On a terminal contacted with the E-Meter in an assessment, if needle action slows down, with little change in its action, run the terminal to a comm lag flat point, then do another assessment, and run the terminal found. Remember all terminals run and check them out on an E-Meter later. It may be that after getting one terminal handled you will have to go back to a terminal flattened on a comm lag basis and re-run it.

Eventually the tone arm will come to clear reading for the PC's sex but only if many terminals are run and come back to and run again.
