HCO BULLETIN OF 17 SEPTEMBER 1968

Class VIII

OVERRUN PROCESS

The Process "What has been overrun?" is used when pc has a chronically high T/A.

It is run by taking each reading item and getting the time or times it was released. Run each to clean needle or FN.

The item is taken up as it reads and the releases in it rehabbed. Then the next item is listed and handled the same way.

More than one F/N can be attained on the list as the items are different subjects.

Each item as rehabbed is taken as far as it will go. It does not necessarily F/N. It must not be over rehabbed.

The odd phenomena of high TA "F/Ns" must be looked for and tell you when an item is rehabbed enough. Eventually after many are rehabbed a real and normal F/N will occur with TA between 2 & 3. TA action will then have ceased.
